

# MPS TRAINING COURSE

## Quick-Reference Guide

## Objective

To provide a comprehensive **overview of complex in vitro models (CIVM), including microphysiological systems (MPS), and best practices** from the perspective of pharmaceutical industry end-users for evaluating and applying these tools in drug discovery and development.

## Scope

This course will cover the **current and anticipated future uses** of CIVMs, including applications in **efficacy, ADME, and toxicology** studies, with an emphasis on **preclinical assessments**.

### Module I

#### Introduction to CIVM and MPS

- Definition of CIVM and MPS
- Overview of current uses in the pharmaceutical industry
- Technical Considerations for Experimental Design
- Use of PBPK/QSP approaches to integrate in-vitro model endpoints and facilitate risk assessment/clinical translation
- General CIVM/MPS qualification considerations and challenges

### Module II

#### Established CIVM / MPS (Organ-Specific Sessions)

- Organ-specific qualification considerations
  - Phenotypic and functional characterization
  - Essential features
- Application-specific (Safety/ADME/Pharmacology) qualification considerations
  - Test compounds and positive controls
  - Predictive endpoints
  - Comparability or superiority to standard approaches (in-vitro/in-vivo)
- Case examples of use for internal decision making

### Module III

#### Context of Use-Specific Applications of CIVM / MPS

- Overview of special considerations for other COUs
- Additional model qualification and characteristics required for use with non-small molecule modalities
- Focus on non-safety applications

### Module IV

#### CIVM / MPS in Development

- Overview of newer models and applications for interrogating human relevant Safety/ADME/Pharmacology questions
- 'Must have' characteristics of newer models
- Case examples

# MPS TRAINING COURSE

## Module I: Introduction and Qualification of CIVM and MPS

### Quick Reference Guide

[www.iqmps.org/course](http://www.iqmps.org/course)

#### ABOUT MODULE I

Over the past decade, Complex In Vitro Models (CIVM) and Microphysiological Systems (MPS) have become increasingly more diverse in design, capabilities, and sophistication, reaching a point where the industry can now begin to apply these tools across drug discovery and development. While the rigor of qualification required to apply these models is largely dependent upon the specific context of use, there are fundamental technical and methodological considerations for designing CIVM experiments. This module will provide an overview of CIVM and how they are currently used in drug discovery and development, as well as offer insight into how CIVM data may eventually be used in concert with in-silico modeling. This module will also outline key technical considerations, such as cell sources, statistical design, confounding device variables, and construction methodologies. The module will close with an overview of high-level qualifications considerations, such as recapitulation of known drug response and comparability to gold standards. See page 4 for a complete list of all sessions in Module I and the topics covered in each.

#### ABOUT THIS GUIDE

The Module 1 Quick Reference Guide is an overview of key lessons from [Module I Sessions 1-5](#), specifically important considerations to take into account in the early stages of qualifying MPS for various contexts of use, including model and experimental design. The reference guide follows the roadwork for MPS/CIVM use as illustrated on page 5, with technical, biological, and context-of-use (COU) considerations specified for each stage of model qualification. While not exhaustive, this guide provides a high-level overview of the many factors to consider and the variables to control when qualifying MPS for use in pharmaceutical drug discovery and development.

# Module I

## MPS Introduction and Qualification of CIVM and MPS

**Thursday, July 13**

10:00 am – 11:30 am ET

### Session 1 • Introduction to CIVM and MPS

*Nakissa Sadrieh, CDER/FDA*

*Aaron Fullerton, Genentech*

*Anna K. Kopec, Pfizer, Inc.*

- Course introduction
- Course outline
- Overview of models
- Industry use of CIVM/MPS

**Thursday, July 20**

10:00 am – 11:30 am ET

### Session 2 • Technical Considerations for Experimental Design (Part I)

*Jason Ekert, UCB Pharma*

*Rhiannon David, AstraZeneca*

*Jonathan Cairns, AstraZeneca*

- Importance of cell sources and related materials
- Media and ECM compatibility
- Qualification of critical analytical endpoints
- Statistical design

**Thursday, August 24**

1:00 pm – 2:30 pm ET

### Session 3 • Technical Considerations for Experimental Design (Part II)

*Tom Chan, Boehringer Ingelheim Pharmaceuticals*

*James Gosset, Pfizer*

*Rebecca Hsia, Genentech*

*Ratnakar Potla, Genentech*

- Methodologies for construction of models and implications
- Confounding device variables
- Test article pharmacokinetics within the model

**Thursday, September 21**

10:00 am – 11:30 am ET

### Session 4 • Leveraging MPS Data for In-Silico Modeling

*Diane Ramsden, AstraZeneca*

*David Stresser, AbbVie*

*Maarten Huisman, UCB Pharma*

*Carmen Pin, AstraZeneca*

- Use of PBPK/QSP approaches to integrate in-vitro model endpoints and facilitate risk assessment/clinical translation

**Thursday, September 28**

10:00 am – 11:30 am ET

### Session 5 • CIVM/MPS Qualification Considerations and Challenges

*Aaron Fullerton, Genentech*

*Lindsay Tomlinson, Pfizer*

*Christopher A. Hinckley, Biogen*

*Leah Norona, Genentech*

- Considerations around therapeutic modality
- Appropriate biological verification
- Recapitulation of known drug responses
- Clinical translatability
- Comparability to “gold-standard” in the paradigm

**December 4<sup>th</sup>**

1:00 pm – 2:30 pm ET

### Session 6 • Module I Summary

*Aaron Fullerton, Genentech*

*Deidre Dalmas, GSK*

- Review of Module 1 key concepts and questions
- Panel discussion
- Introduce Course Module II

[www.iqmeps.org/course](http://www.iqmeps.org/course)

# Module I Session 1

## Introduction to CIVM and MPS

---

Thursday, July 13  
10:00 am – 11:30 am ET

This session will provide an overview of the objectives and content of the IQ MPS Affiliate Training course followed by an overview of MPS platforms and how the pharmaceutical industry is currently using these and other Complex In Vitro Models.

**Nakissa Sadrieh**  
*Senior Advisor for New  
Alternative Methods,  
CDER/FDA*

**Aaron Fullerton, PhD, DABT**  
*Director, Investigative  
Toxicology, Safety Assessment  
Genentech*

**Anna K. Kopec, PhD**  
*Director, Investigative  
Toxicology  
Global Discovery, Investigative  
& Translational Sciences  
Drug Safety R&D  
Pfizer, Inc.*

# CIVM/MPS Definition within the Affiliate

**Complex in vitro models (CIVM):** Models going *beyond* traditional 2D culture and include several of the following design aspects:

- a multi-cellular environment within biopolymer or tissue-derived matrix
- a 3D structure
- mechanical factors such as stretch or perfusion/flow
- primary or stem cell derived cells
- immune system components

**Fabre et al. *Lab on a Chip*, 2020, 20, 1049-57**

**Complex In Vitro Models (CIVM)** typically denotes model types with a broad range of complexity

**Microphysiological Systems (MPS)** is used to specify models at the more complex end of the spectrum

# Roadmap for MPS/CIVMs Use

## Technical Considerations

### Establish Key Aspects of Biological Relevance:

- Cellular composition
  - Multi-Cellular
  - Differentiation Status
  - Immune Competent
- Functional Readouts/Endpoints
- Model Format Selection
  - Single/Multiple Compartments
- Test Article PK/Exposure
- Calibration of Physical Cues:
  - Flow Rate, Stretch, etc...

## Establish link between Biology → Outcome ---- Organ-Specific ----

### Alignment of model/assay endpoints with:

- Molecular Initiating Events (MIEs)
- Adverse Outcome Pathways (AOPs)
- Toxicity/Disease Phenotypes
- Stability of Phenotype/Key Performance Indicators Over Experimental Time Course
- Characterization of Key Features
- Defined Reference Ranges

### Develop corresponding data analysis based on:

- Replicate Variability
- Analytical Methods
- Experimental Design
- Normalization Strategies
- Positive Controls/Benchmarks

## Context of Use

### Clearly defined objective(s) including:

- Establish Criteria for Positive/Negative Outcomes
- Domain of Applicability
- Strengths and Limitations of the Model
- Comparison to Existing Performance Standards

## Assess sources of variability

- Donor Variability
- Endpoint Linearity
- Model Differentiation/Maturation
- Sample Collection Protocols
- Assay Baseline (Signal/Noise Ratio)
- End Users
- Chip-to-Chip Variance
- Sample Stability
- Run-to-Run Batch Effects

# Module I Session 2

## Technical Considerations for Experimental Design (Part I)

---

Thursday, July 20, 2023  
10:00 AM – 11:30 AM ET

This session will cover the key components that should be considered when developing a MPS model, such as the context of use, and physical and biological inputs (including cells, matrices and media). Furthermore, the concept of good experimental design for MPS will be presented using a case study example.

**Jason Ekert**  
*Head, US Discovery  
Translational Technology*  
UCB Pharma

**Rhiannon David**  
*Director of Microphysiological  
Systems (Safety Assessment)*  
AstraZeneca

**Jonathan Cairns**  
*Principal Biostatistician*  
AstraZeneca

- Rhiannon David (AZ)
- Jason Ekert (UCB)
- Jonathan Cairns (AZ)

# Quick Reference:

## Session 1.2 – Technical Considerations for Experimental Design (Part I)

	Cell Source	Other Cell Variables	Media
Technical	<ul style="list-style-type: none"> <li>• <b>Lifespan</b> concordant with required treatment duration</li> <li>• Stem cell <b>differentiation</b> – embryonic/iPSc -&gt; multiple lineages, adult -&gt; specific lineages</li> <li>• Confirm <b>cells express target of interest</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Donor number</b> and <b>demographics</b> (e.g. age, gender, ethnicity, health status)</li> <li>• <b>Proliferation/Growth kinetics</b> - Passaging and time in culture</li> </ul>	<ul style="list-style-type: none"> <li>• Can all cells <b>access oxygen/nutrients</b> - can be challenging in larger cultures</li> <li>• If <b>serum</b> included, consider <b>source</b> (often animal derived) and <b>drug binding</b> potential (consider reporting free-drug concentration)</li> </ul>
Organ-Specific		<ul style="list-style-type: none"> <li>• <b>Disease cells</b> - source and method of inducing disease phenotype (if necessary)</li> <li>• <b>Phenotype maturity linked to functionality</b> (e.g. iPSC less mature but might be sufficient for organ functionality)</li> </ul>	<ul style="list-style-type: none"> <li>• Do the cells require <b>additional growth factors</b>? Can be added or supporting cells can secrete cytokines, ECM etc</li> <li>• <b>Multi-cell/multi-organ</b> cultures – if a <b>single medium</b> is used, ensure it supports all cell/organ types and maintains expected functionality.</li> </ul>
COU-Specific	<ul style="list-style-type: none"> <li>• <b>Cell types chosen to represent COU-specific needs/endpoints</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Donor number</b> and <b>demographics</b></li> <li>• <b>HLA- matched vs autologous</b> (important for some COU e.g. immune responses)</li> <li>• <b>Disease cells</b> - source and method of inducing disease phenotype (if necessary) <b>Phenotype maturity linked to functionality</b> (e.g. iPSC less mature, but might be sufficient for COU)</li> </ul>	<ul style="list-style-type: none"> <li>• <b>Source of additional growth factors</b> (if needed)</li> </ul>

- Rhiannon David (AZ)
- Jason Ekert (UCB)
- Jonathan Cairns (AZ)

## Session 1.2 – Technical Considerations for Experimental Design (Part I)

	Cell Characterization (prior to treatment)	Matrices & Scaffolds	Statistical Experimental Design
Technical	<ul style="list-style-type: none"> <li>• <b>Cell health/viability</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Source</b>- Natural (Human/Animal/Tumor/Plants) or Synthetic and potential interaction with cells</li> <li>• <b>Reproducibility</b> (natural-derived typically have more batch-to-batch variability compared to synthetic) may need to be balanced with <b>ease of access/use</b> (e.g. Matrigel more available than decellularized matrix)</li> </ul>	<ul style="list-style-type: none"> <li>• Aim - a <b>clear, testable aim</b> matching design &amp; analysis</li> <li>• <b>Blocking of confounding factors</b> to manage known technical variables</li> <li>• <b>Randomisation</b> used to defend against unknown factors</li> <li>• <b>Feasibility</b> – there is always a trade-off between an ideal design and the practical limitations.</li> </ul>
Organ-Specific	<ul style="list-style-type: none"> <li>• <b>Cell marker expression and localization/polarity</b></li> <li>• Organ/cell-specific <b>function</b> to demonstrate physiological relevance</li> </ul>	<ul style="list-style-type: none"> <li>• Choice of scaffold or matrix should be <b>appropriate for the cell/organ type</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Generalisable</b> to the population of interest</li> </ul>
COU-Specific	<ul style="list-style-type: none"> <li>• Organ/cell-specific <b>function</b> to demonstrate relevance for COU</li> </ul>	<ul style="list-style-type: none"> <li>• Choice of scaffold or matrix should be <b>appropriate for the COU</b></li> </ul>	<ul style="list-style-type: none"> <li>• Aim – a <b>clear, testable aim</b> matching design &amp; analysis</li> <li>• Study <b>has appropriate sample size &amp; power</b> (appropriate powering provides a good balance between reproducibility (avoiding "flukes") and conditions explored)</li> <li>• <b>Appropriate controls</b></li> </ul>

# Module I Session 3

## Technical Considerations for Experimental Design (Part II)

Thursday, August 24, 2023  
1:00 PM – 2:30 AM ET

Basic 2D monolayer cultures can fail to predict in vivo pharmaceutical candidate properties such as efficacy, ADME, or toxicity as they lack the necessary physical and biochemical cues found in vivo. MPS aim to fill this gap by exploiting advances in material sciences, microfabrication processes, and engineering to recreate the in vivo environment.

In this session, technical design considerations of MPS are discussed with respect to:

- Material considerations
- Fluid dynamics in systems with flow
- Mechanical stimuli were applicable
- Device qualification and operation
- Body-on-a-chip configuration
- Immune cell incorporation

### Immune Cells

### Endpoint assays

<p><b>Technical</b></p>	<ul style="list-style-type: none"> <li>• <b>Cell- device issues</b> <ul style="list-style-type: none"> <li>• Appropriate controls to factor immune cell-device material, ECM cross talk</li> </ul> </li> <li>• <b>Cell secreted products</b> <ul style="list-style-type: none"> <li>• Factoring in loss of secreted product to device material, ECM.</li> <li>• Establishing baseline levels and defining variability (See endpoint assays)</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• MPS devices enable measurements at a single cell level of multiple analytes. <ul style="list-style-type: none"> <li>• Need for <b>standardizing analyses</b> at such complex data intense scales.</li> <li>• Achieving <b>statistical significance</b> is not possible without limiting variability at the level of single analyte omics.</li> <li>• Need detailed ‘omics’ data to describe model features.</li> </ul> </li> </ul>
<p><b>Organ-Specific</b></p>		
<p><b>COU-Specific</b></p>		<ul style="list-style-type: none"> <li>• <b>Baselines</b> and <b>acceptable ranges</b> need to be established for standard endpoint assays for CoU assays.</li> </ul>

# Module I Session 4

## Leveraging MPS Data for in-Silico Modeling

Thursday, September 21, 2023  
10:00 AM – 11:30 AM ET

With new approach methodologies (NAM) evolving in tandem and at a rapid pace, there is an opportunity to integrate them in ways previously thought impossible. This session aims to initiate discussion on how the diverse and complex datasets derived from CIVM and MPS models may be analyzed using quantitative systems biology (QSP), machine learning, and in silico modeling approaches. Examples will be provided through case studies, and a realistic view of the current gaps as well as future outlooks and opportunities will be discussed.

# Module I Session 5

## CIVM/MPS Qualification Considerations and Challenges

---

Thursday, September 28, 2023  
10:00 AM – 11:30 AM ET

This session will provide an overview of qualification efforts for the use of CIVMs in various contexts of use and will include both a high-level overview of the current qualification landscape as well as examples of internal fit-for-purpose qualification efforts within Pharma companies for different contexts of use and discuss how these complex models present unique challenges to using traditional assay validation framework.
